

### Key Design Features

- Synthesizable, technology independent VHDL Core
- Versatile 24-bit RGB video scaling engine capable of scaling up or down by any aspect ratio
- 24-bit accumulator with 24-bit scale-pitch in [24 12] format
- Supports all video resolutions between 16x16 and 4096x4096 pixels
- Fully pipelined architecture with simple flow control
- Features a 5-tap polyphase filter in the x-dimension and a 2-tap polyphase filter in the y-dimension. Each filter has 16 unique phases or interpolation points
- Fully programmable filter coefficients to suit the desired application
- Example general purpose 'Lanczos2' coefficients shipped with the design. Different filter coefficient sets available on request
- Output rate is 1 x 24-bit pixel per clock for scaling factors > 1
- No frame buffer required
- Supports 200MHz+ operation on basic FPGA devices<sup>1</sup>

### Applications

- Studio quality 24-bit RGB video scaling
- Conversion of popular video formats to any aspect ratio such as VGA to XGA or SVGA to HD1080p
- Digital TV set-top boxes and home media solutions
- Conversion to non-standard video resolutions - e.g. for use in portable devices, LCD and flat-panel displays
- Dynamic scaling of video in a window on a frame-by-frame basis
- Picture-in-Picture (PiP) applications

### Generic Parameters

Generic name	Description	Type	Valid range
line_width	Width of linstores in pixels	integer	$2^4 < \text{pixels} < 2^{12}$
log2_line_width	Log2 of linstore width	integer	$\log_2(\text{line\_width})$

### Block Diagram

Figure 1: Video Scaler Architecture

### Pin-out Description

Pin name	I/O	Description	Active state
clk	in	Synchronous clock	rising edge
reset	in	Asynchronous reset	low
scale_pitch_x	in	1 / (x scale factor) Specified as an unsigned number in [24 12] format Range: $0 < \text{pitch} < 2^{24}$	data
scale_pitch_y	in	1 / (y scale factor) Specified as an unsigned number in [24 12] format Range: $0 < \text{pitch} < 2^{24}$	data
pixels_per_line	in	Desired number of pixels per line in the scaled output image Range: $2^4 < \text{lines} < 2^{12}$	data
lines_per_frame	in	Desired number of lines per frame in the scaled output image Range: $2^4 < \text{lines} < 2^{12}$	data

<sup>1</sup> Xilinx Virtex 5 used as a benchmark

**Pin-out Description cont ...**

Pin name	I/O	Description	Active state
pixin [23:0]	in	24-bit RGB pixel in	data
pixin_vsync	in	Vertical sync in (Coincident with first pixel of input frame)	high
pixin_hsync	in	Horizontal sync in (Coincident with first pixel of input line)	high
pixin_val	in	Input pixel valid	high
pixin_rdy	out	Ready to accept input pixel (Handshake signal)	high
pixout [23:0]	out	24-bit RGB pixel out	data
pixout_vsync	out	Vertical sync out (Coincident with first pixel of output frame)	high
pixout_hsync	out	Horizontal sync out (Coincident with first pixel of output line)	high
pixout_val	out	Output pixel valid	high
pixout_rdy	in	Ready to accept output pixel (Handshake signal)	high

**General Description**

XY\_SCALER is a studio quality RGB-video scaler capable of generating interpolated output images from 16x16 up to 4096x4096 pixels in resolution. The architecture permits seamless scaling (either up or down) depending on the chosen scale factor. Internally, the scaler uses a 24-bit accumulator and a bank of polyphase FIR filters with 16 phases or interpolation points. All filter coefficients are programmable, allowing the user to define a wide range of filter characteristics.

Pixels flow in and out of the scaling engine in accordance with the valid-ready pipeline protocol. Pixels are transferred into the scaler on a rising clock-edge when *pixin\_val* is high and *pixin\_rdy* is high. Likewise, pixels are transferred out of the scaler on a rising clock-edge when *pixout\_val* is high and *pixout\_rdy* is high. As such, the pipeline protocol allows both input and output interfaces to be stalled independently.

The scaler is partitioned into a horizontal scaling section in series with a vertical scaling section (Figure 1). Both components are available as separate cores and as such, the *xy\_scaler* is essentially a top-level wrapper for these components.

**Scale pitch, pixels per line and lines per frame**

The output resolution of the scaled output image is controlled by the generic parameters *scale\_pitch\_x*, *scale\_pitch\_y*, *pixels\_per\_line* and *lines\_per\_frame*. The scale pitch may be calculated using the following formula:

$$pitch = (Input\ resolution / Output\ resolution) * 2^{12}$$

As an example, consider the scaling of VGA format video (640x480) to XGA format video (1024x768). In this case the scale pitch in the x and y dimensions would be 0.625. As the value must be specified as a 12.12-bit number the actual scale pitch must be multiplied by  $2^{12}$  giving the generic value '2560'.

Ultimately, as the scale pitch is a quantized number, the number of generated output pixels and output lines for a given scale factor may differ slightly by the desired amount. For this reason, the parameter *pixels\_per\_line* and *lines\_per\_frame* allow the exact resolution of the output video to be specified. The following tables give a list of generic parameters required for the conversion of some example video formats.

**SCALE UP**

Video in	Video out	Scale pitch x	Scale pitch y	Pixels per line	Lines per frame
VGA (640x480)	SVGA (800x600)	3277	3277	800	600
SVGA (800x600)	XGA (1024x768)	3200	3200	1024	768
XGA (1024x768)	HD1080 (1920x1080)	2184	2913	1920	1080
SXGA (1280x1024)	2K (2048x1080)	2560	3884	2048	1080

**SCALE DOWN**

Video in	Video out	Scale pitch x	Scale pitch y	Pixels per line	Lines per frame
SVGA (800x600)	VGA (640x480)	5120	5120	640	480
XGA (1024x768)	SVGA (800x600)	5243	5243	800	600
HD1080 (1920x1080)	XGA (1024x768)	7680	5760	1024	768
2K (2048x1080)	SXGA (1280x1024)	6554	4320	1280	1024

**Flow control**

Pixels flow in and out of the scaling engine in accordance with the valid-ready pipeline protocol<sup>2</sup>. The scaling operation occurs on a line-by-line basis with the signal *pixin\_hsync* specifying the start of a new line and *pixin\_vsync* specifying the start of a new frame. All pixels into the scaler (including *vsync* and *hsync*) must be qualified by the *pixin\_val* signal asserted high, otherwise changes to the input signals will be ignored. Note that the first pixel of a new frame is accompanied by a valid *vsync* and *hsync*. The first pixel in a new line is accompanied by *hsync* only.

On receipt of the first *vsync*, the scaling operation begins and output pixels are generated in accordance with the chosen scale parameters. Generally, for scale-down (decimation) operations, the input interface will not stall. Conversely, for scale-up (interpolation) the number of output pixels will be greater than the number of input pixels. This will result in the occasional stalling of the input due to the change of data rate.

<sup>2</sup> See ZIPcores application note: [app\\_note\\_zc001.pdf](#) for more examples of how to use the valid-ready pipeline protocol

### Loading of scale parameters

The input parameters *scale\_pitch* and *lines\_per\_frame* are loaded into the scaler at the start of each new frame. The parameters are considered valid when *pixin\_val* and *pixin\_vsync* are both high. In all other cases, the state of the scale parameters is ignored. The fully programmable scale parameters allow the input video to be scaled differently on a frame-by-frame basis. Alternatively, different video sources can be multiplexed into the same scaler with different scaling parameters.

### Scaling algorithm

The scaler uses a 5-tap polyphase filter in the x-dimension and a 2-tap polyphase filter in the y-dimension. By default, the x-filter uses a coefficient set sampled from the Lanczos2 function (Figure 2). The y-filter uses bi-linear interpolation (Figure 3). Of course, the user is permitted to use any type of function to derive the filter coefficients depending on the application<sup>3</sup>.

Figure 2: Lanczos2 windowed-sinc function - x-filter tap positioning

Figure 3: Bi-linear function - y-filter tap positioning

### Functional Timing

Figure 4 shows the signalling at the input to the scaler at the start of a new frame. The first line of a new frame begins with *pixin\_vsync* and *pixin\_hsync* asserted high together with the first pixel. Note that the signals *pixin*, *pixin\_vsync* and *pixin\_hsync* are only valid if *pixin\_val* is also asserted high. In addition, the diagram shows what happens when *pixin\_rdy* is de-asserted. In this case, the pipeline is stalled and the upstream interface must hold-off before further pixels are processed.

Figure 4: First line of a new frame

Figure 5 shows the signalling at the output of the scaler. The output uses exactly the same protocol as the input. Each new output line begins with *pixout\_hsync* and *pixout\_val* asserted high. In this particular example, it shows *pixout\_val* de-asserted for 1 clock-cycle, in which case, the output pixel should be ignored. Remember that transfers at a valid-ready are only permitted when valid and ready are both simultaneously high.

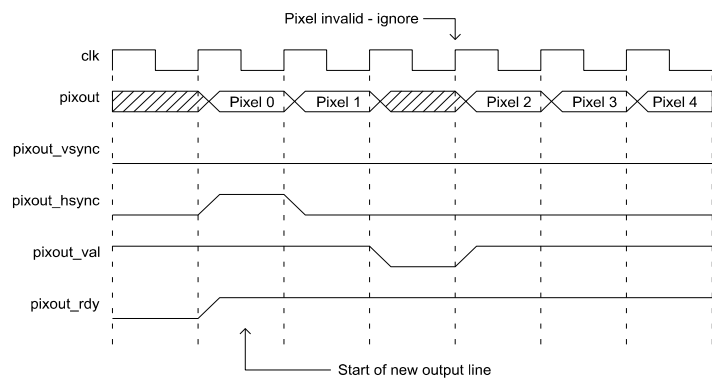

Figure 5: Scaler output showing invalid pixel

<sup>3</sup> See ZIPcores application note: [app\\_note\\_zc003.pdf](#) for examples of how to generate coefficient sets

## Source File Description

All source files are provided as text files coded in VHDL. The following table gives a brief description of each file.

Source file	Description
video_in.txt	Text-based source video file
video_file_reader.vhd	Reads text-based source video file
pipeline_reg.vhd	Pipelined register element
pipeline_shovel.vhd	Pipelined 'shovel' register
ram_dp_w_r.vhd	Dual port RAM component
fifo_sync.vhd	Synchronous FIFO
x_buffer.vhd	Pixel input buffer/shift register
x_filter_pack.vhd	Package containing x-filter coefficients
x_filter_polyphase.vhd	Horizontal scaler output pixel filter
x_scaler.vhd	Horizontal scaler component
y_buffer.vhd	Line buffer
y_filter_pack.vhd	Package containing y-filter coefficients
y_filter_polyphase.vhd	Vertical scaler output pixel filter
y_scaler.vhd	Vertical scaler component
xy_scaler.vhd	Video scaler top-level component
xy_scaler_bench.vhd	Top-level test bench

## Functional Testing

An example VHDL testbench is provided for use in a suitable VHDL simulator. The compilation order of the source code is as follows:

1. video\_file\_reader.vhd
2. pipeline\_reg.vhd
3. pipeline\_shovel.vhd
4. ram\_dp\_w\_r.vhd
5. fifo\_sync.vhd
6. x\_buffer.vhd
7. x\_filter\_pack.vhd
8. x\_filter\_polyphase.vhd
9. x\_scaler.vhd
10. y\_buffer.vhd
11. y\_filter\_pack.vhd
12. y\_filter\_polyphase.vhd
13. y\_scaler.vhd
14. xy\_scaler.vhd
15. xy\_scaler\_bench.vhd

The VHDL testbench instantiates the XY\_SCALER component and the user may modify the generic parameters in order to generate the desired scaled output image.

The source video for the simulation is generated by the video file-reader component. This component reads a text-based file which contains the RGB pixel data. The text file is called *video\_in.txt* and should be placed in the top-level simulation directory.

The file *video\_in.txt* follows a simple format which defines the state of signals: *pixin\_val*, *pixin\_vsync*, *pixin\_hsync* and *pixin* on a clock-by-clock basis. An example file might be the following:

```

1 1 1 00 11 22 # pixel 0 line 0 (start of frame)
1 0 0 33 44 55 # pixel 1
0 0 0 00 00 00 # don't care!
1 0 0 66 77 88 # pixel 2
.
.
1 0 1 00 11 22 # pixel 0 line 1 etc..
    
```

In this example, the first line of of the *video\_in.txt* file asserts the input signals *pixin\_val* = 1, *pixin\_vsync* = 1, *pixin\_hsync* = 1 and *pixin* = 0x001122.

The simulation must be run for at least 10 ms during which time an output text file called *video\_out.txt* will be generated. This file contains a sequential list of 24-bit output pixels in the same format as *video\_in.txt*. The example provided scales a 640x480 (VGA) source image by a factor of 1.6 in the x and y dimensions to give an output image of 1024x768 pixels.

## Performance

The Digital Video Scaler was tested with a large number of scale factors to verify correct operation and to observe the quality of the output image. The true definition and quality is difficult to show within the limitations of this document, but the following figures may give an idea of what is achievable.

Figure 6: Original Testcard VGA Source image (640x480)

Figure 6 shows the original testcard source image at 640x480 (VGA) resolution. Figure 7 is a scale-down of this image to 512x384 pixels. For instance, this is equivalent to scaling down SVGA to VGA format.

Figure 7: Scale-down by 0.8 - e.g. SVGA to VGA format

Figure 8 demonstrates a scale-up of the original source image by a factor of 1.28 in x and y. The video scaler is completely versatile and permits seamless scaling either up or down.

Figure 8: Scale-up by 1.28 - e.g. SVGA to XGA format

Finally, Figure 9 shows the scaling of an image by a factor of 1.875 in the x dimension and 1.406 in the y dimension. As an example, this could represent a scaling from XGA to HD1080 formats.

Figure 9: Scale-up by 1.875 in x and 1.406 in y - e.g. XGA to HD1080

If you would like to see the original bitmap source images, or if you would like to see further examples, please contact ZIPcores and we would be happy to send them to you for further inspection.

## Synthesis

The files required for synthesis and the design hierarchy is shown below:

- xy\_scaler.vhd
  - pipeline\_reg.vhd
  - x\_scaler.vhd
    - pipeline\_shovel.vhd
    - x\_buffer.vhd
    - x\_filter\_polyphase.vhd
      - pipeline\_reg.vhd
  - y\_scaler.vhd
    - pipeline\_shovel.vhd
    - y\_buffer.vhd
      - ram\_dp\_w\_r.vhd
    - fifo\_sync.vhd
      - pipeline\_reg.vhd
    - y\_filter\_polyphase.vhd
      - pipeline\_reg.vhd

The VHDL core is designed to be technology independent. However, as a benchmark, synthesis results have been provided for the Xilinx Virtex 5 and the Altera Stratix III series of FPGA devices. The lowest and highest speed grade devices have been chosen in both cases for comparison.

Fixing the scale parameters at the scaler input will result in the most optimum scaler design. In addition, the speed of the design may be improved by tying the signal *pixout\_rdy* low. This may be possible if the designer knows that the pipeline downstream of the scaler will always be able to accept output pixels. Careful attention must be made to the width of the line stores as this will effect the amount of RAM resource used in the design.

Trial synthesis results are shown with the generic parameters set to: *line\_width* = 1024 and *log2\_line\_width* = 10.

Resource usage is specified after Place and Route.

**VIRTEX 5**

<b>Resource type</b>	<b>Quantity used</b>
Slice register	922
Slice LUT	1104
